SUMMARY

Third-year Systems Engineering PhD candidate with experience in optimization, deep learning, and reinforcement learning, with a focus on distributionally robust learning and representation learning. Develops robust and interpretable methods that connect theoretical algorithms with real-world applications.

EXPERIENCE

Representation Learning, Subspace Constrained Test-Time Adaptation Boston
PhD Researcher May 2026 – Present

- Developed a training-free test-time adaptation method that keeps model weights fixed while optimizing perturbations to hidden representations.
- Restricted perturbations to low-dimensional, input-dependent subspaces so that hidden-state updates follow semantically meaningful directions.

Interpretable Machine Learning, Explainable Feature Extraction Boston
PhD Researcher May 2026 – Present

- Developed a Gram-Schmidt style procedure to identify directions associated with predefined linguistic features and remove them from the embedding space.
- Searched the residual subspace for additional predictive, interpretable features not captured by the initial feature set.

Natural Language Processing, Distributionally Robust Token Optimization Boston
PhD Researcher Aug 2025 – May 2026

- Integrated distributionally robust learning with Reinforced Token Optimization to improve LLM stability under shifts in math and coding problem distributions.
- Designed span-level robust objectives that emphasize difficult response segments and verifier-aware rewards, improving out-of-distribution reasoning without sacrificing in-distribution accuracy.

Clinical Decision Support Pilot, Distributionally Robust Prescriptive Modeling Boston
PhD Researcher Sep 2024 – Present

- Developed a machine learning model using anonymized Electronic Health Record (EHR) data from Boston Medical Center to support hypertension prescribing. Applied distributionally robust learning to handle population variability and provide reliable treatment recommendations.
- Collaborated on a quality-improvement pilot integrating AI-powered clinical decision support into the Epic EHR system to help clinicians compare personalized hypertension treatment options.

Healthcare Research, Distributionally Robust Learning in Survival Analysis Boston
PhD Researcher Jun 2024 – Dec 2024

- Developed a distributionally robust Cox model to improve survival prediction under covariate shift, outliers, and population heterogeneity.
- Derived a tractable optimization formulation and evaluated the method on simulated and clinical datasets.

AIInnovation Beijing, China
Intern Computer Vision Engineer May 2021 – Aug 2021

- Translated industrial requirements into computer vision tasks and coordinated data collection and evaluation metrics.
- Fine-tuned ResNet and LSTM architectures for automated product recognition, combining spatial and sequential modeling to meet target F1-score benchmarks.
- Configured YOLOv2 for real-time video detection and tuned anchors and model parameters to maintain high precision across varied operating conditions.

PUBLICATIONS

[Distributionally Robust Token Optimization in RLHF](#) Under Review, NeurIPS 2026

SKILLS

Python (PyTorch, GurobiPy, CVXPY, Transformers), MATLAB, Representation Learning, Test-Time Adaptation, Reinforcement Learning from Human Feedback, Robust Optimization

EDUCATION

Boston University

Boston

PhD Candidate in Systems Engineering

Sep 2023 – Present

- Current GPA: 4.0/4.0
- Relevant coursework: Convex Optimization, Combinatorial Optimization, Graph Theory.

Columbia University

New York

Master of Science in Operations Research

Sep 2021 – Dec 2022

- GPA: 3.8/4.0
- Relevant coursework: Algorithm Analysis, Matching Algorithms, Optimization, Simulation, Stochastic Models, Game Theory, Algorithmic Trading.

University of California, Los Angeles

Los Angeles

Master of Arts & Bachelor of Science in Mathematics

Sep 2016 – Jun 2020

- GPA: 3.7/4.0
- Enrolled in the Mathematics Honors Program and Departmental Scholars Program; earned B.S. and M.A. degrees simultaneously.
